

forsus

The Forsus is a fixed appliance that is used for Dental Asymmetry Corrections when higher force is needed. This appliance allows the patient to open and move the jaw freely.

Cool water, toothpaste and a toothbrush are needed to clean your appliance. Brush your teeth as usual, paying attention to the bands that hold it in. Brush gently along the gum line to remove the plaque. Extra brushing is important. Brush often, at least three times a day for two minutes at a time.

If your appliance becomes loose, or if you have any questions, please give us a call.
